DOMjudge sample problem
`fltcmp` – 'Floating point compare text'

Problem description

This program tests the special floating point compare script accompanying DOMjudge. The problem input consists of first a line with a single integer, then that many lines, with on each line a floating point number (possibly also ± `inf` or `nan`). For each floating point number, a line should be written containing the reciprocal of the number, within 10^{-6} precision.

Sample input/output

Sample input and output for this problem:

Input	Output
8 +0 1.0 2E0 3 4.0000000000000 5.0000000000001 Inf nan	inf 1.0 0.50000000001 3.333333333E-1 0.25 2E-1 0 NaN
